APPLY ONCE, GLIDE FOREVER.

1 One-Time Application

0 Zero Harmful Environment Effects When Cured

∞ Infinite Glide

PHANTOM GLIDE

PHANTOM is a permanent, one-time application base treatment that provides increased glide across all conditions. A disruptive, truly innovative solution that ushers in a new era in snowsports.

PHANTOM's patent-pending polymer technology offers ultimate convenience combined with great glide performance. Cured PHANTOM is an inert substance, meaning your skis or snowboard can continue to glide while not contaminating the watershed.

THREE UNDENIABLE BENEFITS.

One-Time Permanent Application

PHANTOM only needs to be applied once...ever. It penetrates deep into the base material and is permanently bonded, regardless of the number of days ridden. Unlike wax, **PHANTOM** isn't a topical layer that wears off immediately and requires continual application to achieve performance.

Faster Than Universal Wax

Consistent glide and speed. **PHANTOM** is fast across a broad range of conditions and temperatures. **PHANTOM** mirrors the glide of all-temperature wax in most mid-winter snow conditions, and exceeds it in warmer snow temperatures.

Environmentally Friendly

Traditional fluoro waxes are comprised of unstable toxic chemicals that breach into the watershed, causing widespread damage to the ecosystem and health of all living organisms. **PHANTOM** is engineered to feature the fastest components of traditional fluoro waxes but in functional groups that are fully inert to the environment once cured.

“PHANTOM is without a doubt going to disrupt the waxing and ski-tuning world as we know it.”

— FREESKIER 

“I honestly can say I will never apply traditional hot wax on my snowboards again....EVER. I never thought I would speak those words as a ski/board tune tech of 20 years!”

— John Norman, Tuning Manager
Aspen Skiing Company

“PHANTOM’s permanence and performance will change the game in ways that are hard to imagine now, but in a few years’ time, we’ll be scratching our heads wondering how we ever skied without it.”

— **SKI**
FIRST CHAIR TO LAST CALL

PHANTOM

PHANTOM penetrates deep into the base of your ski or snowboard and is permanently bonded. It only needs to be applied once...ever.

Traditional Wax

Wax is a topical layer that begins to wear off immediately, and requires continual application to realize performance.

With **PHANTOM**, you apply the formula once at any point in your ski or boards' life cycle, whether new or used.

 Permanence in Detail.

Permanence breeds ultimate convenience. With PHANTOM, you apply the formula once at any point in your ski or snowboard's life cycle, whether new or used.

It's that simple. **PHANTOM**'s sophisticated, timed polymerization process permanently penetrates deep into the base material with powerful go-fast fluoro compositions designed to operate across all snow temperatures. Even when the ski or snowboard goes into a shop for stone grinding, the next fresh layer of **PHANTOM** is exposed – ready to glide.

Performance in Detail.

Unless you are constantly waxing with correct temperature specific waxes, **PHANTOM** is faster across all conditions over time because its performance is consistent, whereas conventional wax quickly wears away, causing glide to deteriorate.

Periodic base maintenance is essential to optimize the performance of your **PHANTOMed** skis/snowboard. With occasional base polishing to remove the natural abrasive effects of harsh snow, **PHANTOM** keeps running surfaces gliding like new. In the case of severe abrasion, a fresh stone grind is recommended; this will eliminate micro-hairs and yield a fresh **PHANTOM** surface.

Performance in Detail.

- PHANTOM Base Glide Treatment
- Universal Wax
- Fluoro Race Wax
- Waxless Base

“I coach racing and ski everyday. For an entire season, my PHANTOMed skis performed perfectly in all conditions, from hard abrasive man-made snow, through wet sticky elephant snot, and all the way to cold dry powder. They glided without fault in all conditions.”

– Angus Rose, Alpine Race Coach, New Zealand

EXTENDED RACE PERFORMANCE

*WAX ADHESION IMPROVEMENT ON PHANTOM TREATMENT SERVING AS RACE WAX UNDERLAY.

Environment in Detail.

Today's snow is tomorrow's water.

Cured **PHANTOM** is an inert substance, meaning your skis or snowboard can continue to glide without contaminating the watershed. The innovation centers around the inclusion of short-chain, glide-friendly fluorocarbon functional groups, but in a superior, new delivery method that renders them inert and harmless to humans, plants and animals, once cured into a ski or snowboard base. Cured **PHANTOM** doesn't cause biological damage, and doesn't present any long-term environmental risks.

“PHANTOM’s environmentally friendly formula has the potential to upend the wax industry.”

– **BACKPACKER**

Today's snow is tomorrow's water.

“PHANTOM helps us do what we do best, which is provide a better on-mountain experience with less environmental harm. We’ll keep wax particles out of the watershed, and we’ll ski or ride on a consistently fast base. We love it.”

**-Auden Schendler, VP Sustainability,
Aspen Skiing Company**

Because wax is inherently softer than base material, friction from snow causes it to shed into the ecosystem during the use and degradation process (the reason you have to constantly reapply wax). You can see this effect on a warm day when the snow beneath your boards turns the color of your wax. When the snow melts, wax flows into streams, rivers, and soil. Toxic chemicals then react with organic systems: fish, land animals, plants, and human drinking water are all subject to reactions that create permanent free radical damage. Worse yet, PFCs are indestructible and proliferate indefinitely throughout the ecosystem, causing ongoing damage to life.

PHANTOM upends this whole narrative, and presents a clean future for snowsports while delivering both performance and convenience.

Home Application.

PHANTOM can be applied by an individual with access to direct and consistent UV sunlight to activate and cure the formula. Ideally, this should be done during the Spring, Summer, and Autumn seasons when the sun is high and temperatures are above freezing. For proper **PHANTOM** application, it's critical for there be strong, direct sunlight and temperatures over 32°F / 0°C.

- **PHANTOM** 1-part cure time under direct outdoor sun is roughly 1 hour. It takes approximately 20 minutes of additional prep work and brushing to complete an application.
- Not-provided items/services needed for proper DIY **PHANTOM** application include a ski or snowboard base cleaner, or alternatively, employing a ski/snowboard shop to clean bases via stone grinding prior to application.

Cure Station.

PHANTOM can be applied professionally by an authorized **PHANTOM** installer using a **PHANTOM** Cure Station.

The curing process takes approximately 20 minutes, with some additional preparation and soak time. Cure Station application, available at select **PHANTOM** dealers, is the most precise and fastest method to apply **PHANTOM** to skis or snowboards, and is a reliable all-season solution during the low light winter months, especially in more extreme latitudes, and in wetter climates where sunshine isn't consistent.

“Beyond the convenience factor, the health and environmental benefits of PHANTOM will make it a no-brainer for most riders.”
